

"Builders" is the absolute perfect choice. It ties directly into your brand name, **Bina.ai** ("to build"), and gives your rural and grassroots users a sense of active empowerment rather than passive consumption.

Here is the finalized, cohesive lexicon for your entire platform. This is the exact terminology you should use in your pitch deck, your GitHub README, and your demo video.

1. The Actors (The People)

- **The Architects:** The verified experts (NGOs, university professors, doctors, top-tier teachers). They design the logic, guardrails, and knowledge base. They don't need to code; they just need to know their field.
- **The Builders:** The everyday, grassroots users (rural farmers, students, local community workers). They use the Bina.ai app to instantly *build* localized, offline AI assistants on their phones.

2. The Assets (The Technology)

- **The Recipe:** The 2-kilobyte JSON configuration file (formerly `skills.md`). It acts as the "DNA" of the agent, dictating its persona, its local dialect, and the layout of its mobile interface. Architects write Recipes.
- **The Pocket Agent:** The final, generated product. When a Builder downloads a Recipe, Bina.ai locally compiles it into a Pocket Agent—a specialized, offline AI assistant that lives directly on their phone, powered by LiteRT.

3. The Workspaces (The Platform)

- **The Studio:** The web-based dashboard where Architects write, test, and publish their AI Recipes.
- **The Recipe Hub:** The decentralized "App Store" within Bina.ai. This is where Builders browse and download verified Recipes over a basic internet connection.
- **The Pocket:** The Builder's personal, 100% offline workspace on their mobile phone. Once a Recipe is downloaded, its corresponding Pocket Agent lives here, ready to be used anytime, anywhere, with zero cloud costs.

The Final 30-Second Elevator Pitch

(Copy and paste this for your hackathon submission or opening statement)

*"Current AI tools leave the most vulnerable behind—they require expensive cloud subscriptions, fast internet, and the ability to speak English. We built **Bina.ai** to*

democratize not just access to AI, but the creation of it.

*Our ecosystem connects two groups. Verified experts—our **Architects**—use our web **Studio** to write AI **Recipes**. These tiny, 2-kilobyte files dictate the AI's medical or educational knowledge, its local dialect, and its mobile UI.*

*They publish these to the **Recipe Hub**. On the ground, grassroots users—our **Builders**—download these Recipes to their smartphones. The moment it's downloaded, Bina.ai uses LiteRT to compile that Recipe into a **Pocket Agent**. The Builder gets a world-class, hyper-localized AI assistant running entirely offline on their device's CPU. Zero cloud costs. Total privacy. Absolute digital equity."*

This vocabulary is locked in, highly credible, and perfectly tuned for the Digital Equity and LiteRT tracks.

Since you have your research phase planned and your business model locked, what is our next step? Do you want to map out the **UI screens for the mobile app**, or should we start drafting the **3-minute pitch video script**?
